1

WHAT IS THE SHELL?

When we speak of the command line, we are really referring to the *shell*. The shell is a program that takes keyboard commands and passes them to the operating system to carry out. Almost all Linux distributions supply a shell program from the GNU Project called bash. The name is an acronym for *bourne-again shell*, a reference to the fact that bash is an enhanced replacement for sh, the original Unix shell program written by Steve Bourne.

Terminal Emulators

When using a graphical user interface (GUI), we need another program called a *terminal emulator* to interact with the shell. If we look through our desktop menus, we will probably find one. KDE uses konsole, and GNOME uses gnome-terminal, though it's likely called simply Terminal on your menu. A number of other terminal emulators are available for Linux, but they all basically do the same thing: give us access to the shell. You will probably develop a preference for one or another terminal emulator based on the number of bells and whistles it has.

Making Your First Keystrokes

So let's get started. Launch the terminal emulator. Once it comes up, we should see something like this:

[me@linuxbox ~]\$

This is called a *shell prompt*, and it will appear whenever the shell is ready to accept input. While it might vary in appearance somewhat depending on the distribution, it will typically include username@machinename, followed by the current working directory

If the last character of the prompt is a hash mark (#) rather than a dollar sign, the terminal session has superuser privileges. This means either we are logged in as the root user or we selected a terminal emulator that

provides superuser (administrative) privileges.

(more about that in a little bit) and a dollar sign.

Assuming things are good so far, let's try some typing. Enter some gib-

berish at the prompt like so:

[me@linuxbox ~]\$ kaekfjaeifj

Because this command makes no sense, the shell tells us so and gives us another chance.

bash: kaekfjaeifj: command not found

[me@linuxbox ~]\$

Command History

If we press the up arrow, we will see that the previous command entered, kaekfjaeifj, reappears after the prompt. This is called command history. Most Linux distributions remember the last 1,000 commands by default. Press the down arrow and the previous command disappears.

Cursor Movement

Recall the previous command by pressing the up arrow again. If we try the left and right arrows, we'll see that we can position the cursor anywhere on the command line. This makes editing commands easy.

A FEW WORDS ABOUT MICE AND FOCUS

While the shell is all about the keyboard, you can also use a mouse with your terminal emulator. A mechanism built into the X Window System (the underlying engine that makes the GUI go) supports a quick copy-and-paste technique. If you highlight some text by holding down the left mouse button and dragging the mouse over it (or double-clicking a word), it is copied into a buffer maintained by X. Pressing the middle mouse button will cause the text to be pasted at the cursor location. Try it.

Don't be tempted to use CTRL-C and CTRL-V to perform copy and paste inside a terminal window. They don't work. These control codes have different meanings to the shell and were assigned many years before the release of Microsoft Windows.

Your graphical desktop environment (most likely KDE or GNOME), in an effort to behave like Windows, probably has its focus policy set to "click to focus." This means for a window to get focus (become active), you need to click on it. This is contrary to the traditional X behavior of "focus follows mouse," which means that a window gets focus just by passing the mouse over it. The window will not come to the foreground until you click on it, but it will be able to receive input. Setting the focus policy to "focus follows mouse" will make the copy-and-paste technique even more useful. Give it a try if you can (some desktop environments such as Ubuntu's Unity no longer support it). I think if you give it a chance, you will prefer it. You will find this setting in the configuration program for your window manager.

Try Some Simple Commands

Now that we have learned to enter text in the terminal emulator, let's try a few simple commands. Let's begin with the date command, which displays the current time and date.

A related command is cal, which, by default, displays a calendar of the current month.

THE CONSOLE BEHIND THE CURTAIN

Even if we have no terminal emulator running, several terminal sessions continue to run behind the graphical desktop. We can access these sessions, called *virtual consoles*, by pressing CTRL-ALT-F1 through CTRL-ALT-F6 on most Linux distributions. When a session is accessed, it presents a login prompt into which we can enter our username and password. To switch from one virtual console to another, press ALT-F1 through ALT-F6. On most systems, we can return to the graphical desktop by pressing ALT-F7.

To see the current amount of free space on our disk drives, enter df.

[me@linuxbox ~]\$ df	
Filesystem	1K-blocks Used Available Use% Mounted on
/dev/sda2	15115452 5012392 9949716 34%/
/dev/sda5	59631908 26545424 30008432 47% /home
/dev/sda1	147764 17370 122765 13% /boot
tmpfs	256856 0 256856 0% /dev/shm

Likewise, to display the amount of free memory, enter the free command.

[me@linuxbox ~]\$ free

total used free shared buffers cached

Mem: 513712 503976 9736 0 5312 122916

-/+ buffers/cache: 375748 137964 Swap: 1052248 104712 947536

Ending a Terminal Session

We can end a terminal session by closing the terminal emulator window, by entering the exit command at the shell prompt, or by pressing CTRL-D.

[me@linuxbox ~]\$ exit

Summing Up

This chapter marked the beginning of our journey into the Linux command line, with an introduction to the shell, a glimpse of the command line, and a brief lesson on how to start and end a terminal session. We also saw how to issue some simple commands and perform a little light command-line editing. That wasn't so scary, was it?

In the next chapter, we'll learn a few more commands and wander around the Linux file system.
